

# USING CURL TOOL

## Lab Objective:

Learn how to use the Curl tool for manual information gathering.

## Lab Purpose:

Curl stands for Client URL. It is a command line tool for getting and sending data including files using URL syntax.

## Lab Tool:

Kali Linux

## Lab Topology:

We will use Kali Linux for this lab.

## Lab Walkthrough:

### Task 1:

The general syntax for using curl is the following:

**Curl [options] URL**

This is a basic syntax that makes the tool quite simple to use. To get some more information on curl and how it is used, type `curl -help` to display the information screen.

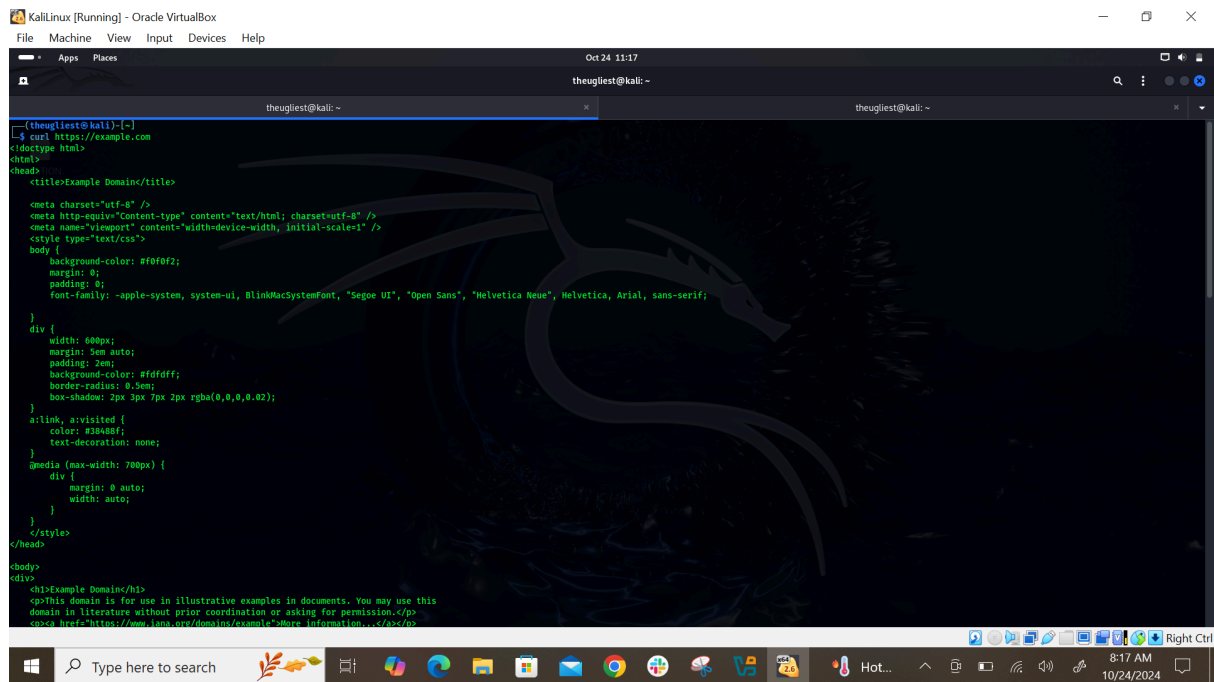

Curl can be installed on Linux using the following command:

```
sudo apt-get install curl
```

### Task 2:

The first task we will perform is getting the source code of a site. The first step is to boot your virtual machine and get Kali Linux up and running. Once this is complete, open a terminal and type the following:

```
curl https://example.com
```

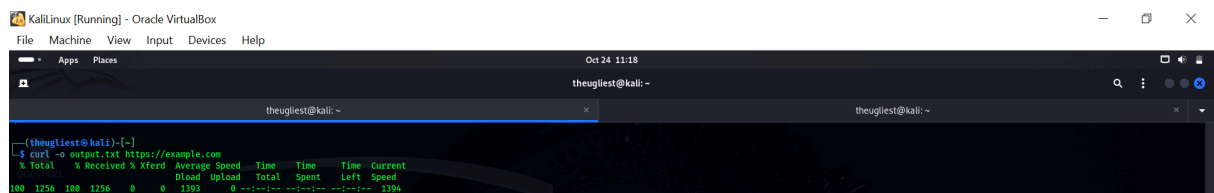

```
(theugliest@kali)-[~]
└─$ curl https://example.com
<!doctype html>
<html>
<head>
<title>Example Domain</title>

<meta charset="utf-8" />
<meta http-equiv="Content-type" content="text/html; charset=utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1" />
<style type="text/css">
  body {
    background-color: #f0f0f2;
    margin: 0;
    padding: 0;
    font-family: -apple-system, system-ui, BlinkMacSystemFont, "Segoe UI", "Open Sans", "Helvetica Neue", Helvetica, Arial, sans-serif;
  }
  div {
    width: 600px;
    margin: 0 auto;
    padding: 20px;
    background-color: #fff;
    border-radius: 0.5em;
    box-shadow: 2px 3px 7px rgba(0,0,0,0.02);
  }
  a:link, a:visited {
    color: #3498db;
    text-decoration: none;
  }
  @media (max-width: 700px) {
    div {
      margin: 0 auto;
      width: auto;
    }
  }
</style>
</head>
<body>
<div>
<h1>Example Domain</h1>
<p>This domain is for use in illustrative examples in documents. You may use this
domain in literature without prior coordination or asking for permission.</p>
<p><a href="https://www.iana.org/domains/example">More information...</a></p>
</div>
</body>
```

To save this output to a file, we will use either the “-o” or “-O” option. The lowercase option saves the file with a predefined filename, while the uppercase option saves the file with its original filename. Basically, the lowercase option allows us to specify a file name. This is a useful option if the webpage we are trying to inspect is preventing us from right clicking on the page to view the source code in the browser. Type the following to save your output:

**curl -o output.txt <https://example.com>**

```
(theugliest@kali)-[~]
└─$ curl -o output.txt https://example.com
  % Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
                                 Dload  Upload   Total   Spent    Left  Speed
100 1256 100 1256  0     0  1393  0 --:--:-- --:--:-- --:--:-- 1394
```

We can see some brief statistic data on this output.

### Task 3:

Curl also provides you with the ability to download multiple files at once. To do this, use multiple -O options, followed by the URL of the file you want to download. For example:

```
(theugliest@kali)[-]
$ curl -O https://arxiv.org/ftp/arxiv/papers/1610/1610.09771.pdf -O
% Total    % Received % Xferd Average Speed   Time    Time     Time  Current
                                 Dload Upload Total Spent Left  Speed
100 846k  100 846k    0     241k      0  0:00:03 --:--:-- 241k
Warning: Got more output options than URLs
```

If your connection drops while downloading a file, you can resume the download with the “-C-” option. This is an especially useful feature when downloading large sized files, ex DVD ISO files, or MP4 video files. This way, if your connection drops when downloading a file, you can resume the download instead of starting from scratch, using, for example:

```
curl -C- -O https://arxiv.org/pdf/2103.08624.pdf
```

**Curl can also be useful for downloading HTTP headers, which is useful when testing a site. To do this,**

```
(thebuglist@kali)-[~]
$ curl -C -O https://arxiv.org/pdf/2103.08624.pdf
% Total    % Received % Xferd Average Speed   Time    Time     Current
                                 Dload  Upload   Total   Spent    Left     Speed
100 249    100 249    0    0      372   0         0 --:--:-- --:--:-- --:--:-- 372

(thebuglist@kali)-[~]
$ curl -C -O https://arxiv.org/pdf/2103.08624.pdf
# Assuming transfer from byte position 249
% Total    % Received % Xferd Average Speed   Time    Time     Current
                                 Dload  Upload   Total   Spent    Left     Speed
0 249    0 0    0    0      0   0         0 --:--:-- --:--:-- --:--:-- 0
```

```
thougthless@kali:~$ curl -I https://example.com
HTTP/2 200
content-encoding: gzip
accept-ranges: bytes
age: 591014
cache-control: max-age=604800
content-type: text/html; charset=UTF-8
date: Thu, 24 Oct 2024 14:52:51 GMT
etag: "3147526947+gzip"
expires: Thu, 31 Oct 2024 14:52:51 GMT
last-modified: Thu, 17 Oct 2019 07:18:26 GMT

x-cache: HIT
content-length: 648

thougthless@kali:~$
```

**This will display many useful pieces of information, such as server info, content type, and content encoding.**

**When attempting to download a file or gather other information using curl, you may discover that the target site may be designed to block curl. In this case, it**

is useful to emulate a browser, such as Firefox, to return the information you are looking for. To do this, use the following command:

```
curl -A "Mozilla/5.0 (X11; Linux x86_64; rv:60.0) Gecko/20100101 Firefox/60.0" https://ifconfig.me
```

A terminal window with a dark background and a dragon logo. The prompt is root@kali:~#. The first command is curl -A "curl" https://ifconfig.me, which returns 192.168.83.66. The second command is curl -A "Mozilla/5.0 (X11; Linux x86\_64; rv:60.0) Gecko/20100101 Firefox/60.0" https://ifconfig.me, which returns a parse error near the closing quote of the user-agent string.

```
root@kali:~# curl -A "curl" https://ifconfig.me
192.168.83.66
root@kali:~# curl -A "Mozilla/5.0 (X11; Linux x86_64; rv:60.0) Gecko/20100101 Firefox/60.0" https://ifconfig.me
bash: parse error near `'"
```

In this example, remote site <https://ifconfig.me> answers with different messages according to clients' user-agent strings.

### Task 6:

Another important feature of curl is its ability to transfer files. This is useful when interacting with servers through the command line, particularly if you are trying to take advantage of potential vulnerabilities. To access a protected FTP server, use the `-u` option to specify the username and password:

```
curl -u "username:pwd" "ftp://mirrors.sonic.net/knoppix/live.iso"
```

To upload a file to the server, we can use the `-T` option:

```
curl -T file.zip -u "username:password" ftp://mirrors.sonic.net/
```

### Task 7:

Normally, curl denies connection to sites which have invalid SSL certificates. To connect without blocking and getting a warning message, we can use the `-k` option, for example: `curl -k http://192.168.1.1/`

### Task 8:

Curl can also be configured to use a proxy. To do this, use the `-x` option followed by the proxy URL. For example:

```
curl -x 192.168.0.1:8080 http://example.com/
```

### Task 9:

**Curl can also be used for sending HTTP POST data to FORM pages.**

**In this example, we are sending two parameters, “tfUName” and “tfUPass”, with attached values to “<http://testasp.vulnweb.com/Login.asp>”.**
